For my final assignment how I made my website have contrast is the wrapper. In the header I have a dark background for the header. The whole theme of the wrapper is monochromatic shades of red. I actually don't have any red in my website, but I liked the colours I picked. It took me a while to figure out what colours I wanted to have on my website. I played around on paletton and found monochromatic shades of red and I really liked the contrast and colour. The overall colour theme has contrast from the red and white text from the headers and the text in the content. I reduced the size of my pictures to fit in with the wrapper and so the caption of the band/artist would be in proportion.

Everything on my website is mostly centered and I like the look of it and the repetition is the same through the three HTML pages. The last HTML page is simple and has a paragraph/description and a picture underneath.There is repetition when I have a caption the picture underneath, it repeats on the first HTML page five times. In the wrapper there is contrast with the black text on a light colour shade of pink that is the background. I made the size of everything not too big and so it would not take up too much room in the content space. I made sure I reduced the size of the pictures, so it would not be that big and grab the viewer's attention, but big enough so that the . Everything is aligned to the center of the page and I like the overall look of it.

The background on the first HTML page, is a picture of fireworks and it is dark, so there is contrast within the page, through the wrapper, headers and texts all on the page. The reason I made my website the way it is, is to display different things about the concerts I have went too, the artists and bands that I like. When I first was designing my first HTML page, I had to make sure the pictures were the correct size and were not too big depending on the size file. The

contrast of the black text on the wrapper content background, gives my website nice contrast. I picked a colour that was light enough to have black text on top of it.

For the second HTML page, I have more pictures on it but decided to give it even more contrast and put a solid black background around the picture. The header on the page is white and contrasts with the header which is a dark shade of maroon. Overall, the second page, is simple but the contrast from the picture border gives the page more contrast.

The last and final HTML page is my favourite concert experience page. On all of these pages I decided not to put a navigation on them. I also decided to keep the wrapper the same on all three pages to have repetition and the same colours. For my meet and greet picture on the last page, I also decided to put a border around it and made the border a shade of the colour theme I have on all my pages.
